

How to use Screen Space Effects

1. Go to the **Piloto Studio > ScreenEffectsBase** folder and duplicate the **ScreenSpace_Base** material. It's easier to start from a material that's already set up.

Do not use Soft Particles.

2. In the same folder, duplicate the **ScreenEffect_Base** prefab, place it inside your effect's hierarchy, and **unpack it**. This prefab is already configured to work and will automatically move into the camera when you hit play.
3. This is the hierarchy of the base screen effect prefab:

4. You only need to modify **"ScreenSpaceEffect_Base"**.
Assign the duplicated material to the effect and edit the material.
5. Set your camera tag to "MainCâmera".

Some useful points:

- Color, alpha, size, and other properties will not behave as expected;
- Use the **Color Ramp** of the material to add color to the particle;
- Use **Dissolve** to make it appear and disappear;
- If the particle looks offset relative to the screen, try adjusting the **Z axis of the "Scaler"**;
- If you need a **Radial** effect, use the mesh **"RadialUV_Door"** that already comes with the effect, but you can also use Billboard or other meshes normally;
- Set the particle's **Order in Layer** high if it is being rendered behind other particles.
